$$\mu_0(\cancel{1}-p^2-\cancel{1}-p^2+2p)=2$$

$$\mu_0(\cancel{2}p-\cancel{2}p^2)=\cancel{2}\,1$$

$$\mu_0=\frac{1}{p-p^2}, \quad \boxed{\mu_0=\frac{1}{p(1-p)}}.$$

OSSERVAZIONI

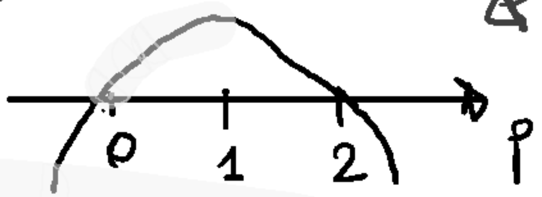
Calcoliamo per completezza μ_1 e μ_2:

$$\mu_1 = 1+p\mu_0 = 1+\cancel{p}\frac{1}{\cancel{p}(1-p)} = \frac{1-p+1}{1-p} = \frac{2-p}{1-p}$$

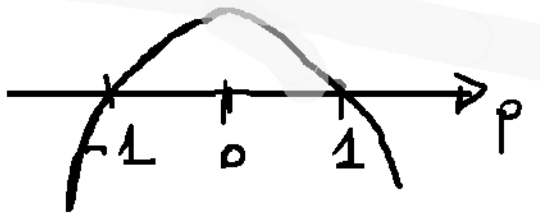
$$\mu_2 = 1+(1-p)\mu_0 = 1+\cancel{(1-p)}\frac{1}{p\cancel{(1-p)}} = \frac{p+1}{p}$$

~~Ci si aspetta che $\mu_1>\mu_0$ e $\mu_2>\mu_0$. In effetti~~

$\frac{2-p}{\cancel{1-p}} \overset{?}{>} \frac{1}{p\cancel{(1-p)}}$ $\quad p(2-p)\overset{?}{>}0$ ERRORE: qui 1 $\quad$ SI



$\frac{p+1}{\cancel{p}} > \frac{1}{\cancel{p}(1-p)}$ $\quad (p+1)(1-p)\overset{?}{>}0$ ERRORE, qui 1 $\quad$ SI



La parte finale va sostituita come segue.

Ci si aspetta che $\mu_1<\mu_0$ e $\mu_2<\mu_0$.

In effetti si verificano così:

- $\frac{2-p}{\cancel{1-p}} \overset{?}{<} \frac{1}{p\cancel{(1-p)}}$, $p(2-p)\overset{?}{<}1$,
  $-p^2+2p-1\overset{?}{<}0$, $-(p-1)^2\overset{?}{<}0$ SI

- $\frac{p+1}{\cancel{p}} \overset{?}{<} \frac{1}{\cancel{p}(1-p)}$, $(p+1)(1-p)\overset{?}{<}1$,
  $\cancel{1}-\cancel{p}+\cancel{p}-p^2\overset{?}{<}\cancel{1}$, $-p^2\overset{?}{<}0$ SI
